## Introduction

Use this tab to view the currently visible region in the Ensembl or UCSC Genome Browsers.

Use this tab to

- See an alternative view on the same data
- Find tracks to download and import into the IGB environment

Both Ensembl and UCSC Genome Bioinformatics sites are accessible via DAS1 data sources in IGB. And the UCSC Genome site has a Table Browser that allows you to download Genome Browser data tracks in formats IGB supports.

So if you see something worth further investigation, you can import the data directly into IGB.

## View a region in an external genome browser

Depending on the genome, you can use **External View** tab to view the currently visible region in the UCSC or Ensembl genome browsers.

To view a region

- Click **External View** tab to open it
- Choose external browser from the menu
- Click **Update**

If you navigate to a new region, click the **Update** button.

## Import UCSC genome browser settings

If you have used a web browser to access the UCSC server and have changed the UCSC view through the browser, you can import those settings into IGB, permitting IGB to display the view in the same way as the web browser. Click the **settings** button (blue box in previous image) and follow the directions in the window.

### Settings window

Customize UCSC settings

### Setting the UCSC user id

If you have already customized the UCSC view in a web browser, IGB can use those settings. Follow the instructions below to link your settings to IGB.

1. Obtain your user id by clicking on the "UCSC info" button. Or open <http://genome.ucsc.edu/cgi-bin/cartDump> in your browser
2. Then scroll down in the opened window and copy the value of hguid into the "UCSC user id" field.
3. Click the submit button.
4. Your IGB UCSC View is now synchronized with your browser track configuration. The settings in your browser now change the view.

## Advice on region sizes

While you can access information on very large regions (spanning 10-15 genes), a smaller region or specific gene may return more data due to more details being available. To use ENSEMBL you must have a fairly zoomed in picture (<100,000 bp) and it must be a species that ENSEMBL curates. The same is true for UCSC, although it can handle slightly larger regions of the chromosome. A smaller region or specific gene may return more data due to more details being available.

Larger regions take longer to load.
